The Movable Objective Microscope® (MOM™) is a two-photon microscope capable of imaging deep within living specimens when combined with a Ti:Sapphire laser. The MOM design is unique in providing 3-dimensional objective movement and rotation allowing the specimen to remain stationary. Many highly regarded imaging laboratories around the world use Sutter MOM and we constantly work with our customers to adapt the design for their changing needs.

**MOM Opto-mechanical Design**

The MOM consists of two independent microscopes. The wide-field half of the microscope consists of an Olympus vertical illuminator, Sutter Xenon arc lamp and camera mount to provide standard epifluorescence. The two-photon side of the microscope provides the optical pathway for guiding the excitation laser light from the table up into the scanning galvanometric mirrors and then expanding the beam through the scan lens and directing into the back of the objective. Following two-photon excitation, the emitted photons are directed by a dichroic mirror immediately above the objective into the detection pathway. The main body of the microscope moves backwards on a rail system allowing easy access to the specimen prior to imaging.

The objective translates in X, Y and Z as well as rotates around the X axis. Two moving mirrors allow the microscope to maintain efficient delivery of the excitation light to the back aperture of the objective regardless of movement or orientation. The X, Y and Z movements used are the same as that in our MP-285 micromanipulator so you know the movements are smooth, fine in scale, drift-free and highly reproducible. These movements permit Z-stacks and mosaic images of large regions of tissue to be recorded without the need for a moving stage.

The horizontal light path allows for rotation of the objective away from the standard vertical position. As a result of this rotation, the MOM can easily be converted from an upright to an inverted microscope and the objective positioned from 0 to 180 degrees. This positional freedom permits the imaging of non-horizontal surfaces and volumes.

**MOM Scanning Systems**

During the last 10 years, scanning technology has changed dramatically: objectives changed requiring larger beam sizes and scanner technology advanced providing dependable resonant scanners. Unlike other two photon microscope designs, the MOM

---

(Shown with optional trinocular head and CCD camera. Objective not included)
has lived through and adapted to changes in scanning technology. Throughout this development, Sutter has maintained two principles. First, existing scopes can be upgraded to new technology as it becomes available. Many original scopes with 3mm galvo scanners have been upgraded to either 6mm galvo scanners or resonant/galvo scanners. Second, Sutter continues to supply the original designs if they are needed for current research. We can provide a 3mm or 6mm conventional scanning MOM™ or a resonant/galvo scanning MOM all at competitive prices.

Sutter MOM packages include all of the equipment (less the Ti:Sapphire laser and objective), needed for a complete imaging system.

- Cambridge Technology XY galvanometric scanners with 3 or 6 mm mirrors
- Hamamatsu photomultiplier tubes (PMTs): R6357 multialkali or H10770PA-40 (GaAsP) products. Sutter is an authorized reseller for Hamamatsu
- Power supplies for PMTs: Either a Sutter PS-2 (dual channel high-voltage power supply for R6357 PMTs) or Sutter PS-2LV (dual channel low-voltage power supply for H1070 (GaAsP) PMTs) can be ordered.
- Hamamatsu C7319 or Sigmann pre-amplifiers
- Data acquisition: National Instruments acquisition boards (NI-6110E)

APPLICATIONS

- In vivo two-photon imaging
- Patch-slice, fixed-stage microscopy
- Non-horizontal surface microscopy
- Simultaneous retinal stimulation and two photon microscopy

*“Eyecup scope-optical recordings of light stimulus-evoked fluorescence signals in the retina”, Euler et al, Pflugers Arch, 2008

MOM BASIC SYSTEM FOR 2-PHOTON MICROSCOPY
Includes Moving Objective Microscope, 2 channel detector with PMTs, preamps and PS-2 Power supply, XY scanners with servo drive, wide field fluorescence unit including vertical illuminator, Lambda LS 300 Watt Xenon Arc lamp, LLG and light guide adapter, C-mount for wide field camera, data acquisition system

MOM-3MM  |  MOM System with 3mm XY scanners
MOM-6MM  |  MOM System with 6mm XY scanners
MOM-RES-MCS  |  MOM System with Resonant scanners and MScan 2.0 software
MOM-RES-S12015  |  MOM System with Resonant scanners and ScanImage 2015

1 Final pricing depends on detector path selected and does not include several devices necessary for a complete 2-photon microscope (i.e. Ti:Sapphire laser, objective, camera, trinocular head, table mount optics). Please phone Sutter for details.

The MOM is both an inverted and upright microscope with 0 to 180° rotation
